

# Clinical Uploader

...a smarter way to upload.

## Intuitive process

The App provides a seamless process with a built-in help facility to guide clinicians through the correct consent and photography process.

Patient data, consent and photographs enter the workflow in one 'package' saving excessive time identifying images or locating paper based consent forms from standard loan cameras.

## Flexible consent model

The consent process can be fully tailored to support your organisational policy and GDPR requirements.

The App also provides a facility for the documentation of photography being carried out in the patient's best interests in instances of mental incapacity, and for the documentation of verbal consent in instances of physical disability.

## Integration

Patient demographics are accessed and verified via the hospital PAS, EPR or job management system. Clinical photographs can be uploaded either to FotoWare software or your preferred third-party image management system.

## Image identification

Photographs are categorised into body regions to enable useful identification for comparison and monitoring purposes, and photographs can be identified as 'sensitive' for special processing and access restrictions if required.

## Supports community working

The device works offline so clinicians can continue working in remote locations. An upload alert will appear when re-connected, then the images will be transferred to your chosen location using end to end encryption.

## Security

A 'Data Protection by Design' approach ensures that all necessary data relating to the photographs is collected prior to upload to ensure that appropriate management controls in the central image management database are supported.

Images taken within the App are never visible in the device gallery or camera roll. All images are temporarily stored in the App container and deleted once uploaded, significantly reducing organisational risk of data breaches.

## User access

The app works with Active Directory eliminating the need for separate login passwords. We also support QR code logins for fast paced environments such as A&E where multiple staff may share a limited number of devices.
