

# MIT – Medialogix Image Transfer

Do you need patients to submit clinical photographs for triage and monitoring purposes?

Medialogix have developed the MIT portal for securely requesting and receiving clinical photographs directly from patients:

- Clinicians create an online request to send to their patient via email and/or text message.
- The request can be personalised by using predesigned upload templates that can also ask a patient for additional details about their medical condition.
- The patient receives the request and logs into the system on a web browser to upload their files and any additional information before submitting the request.

As our product allows the public to upload files, we have opted for a hybrid model where we provide the public infrastructure for uploading.

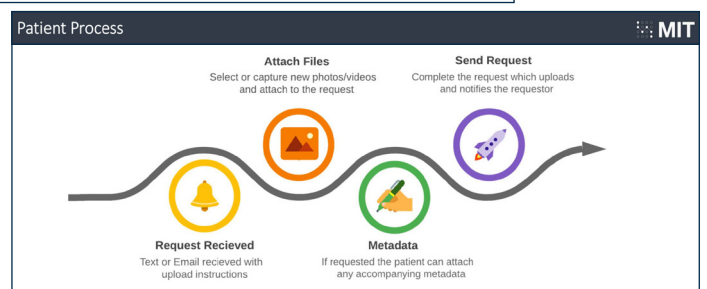

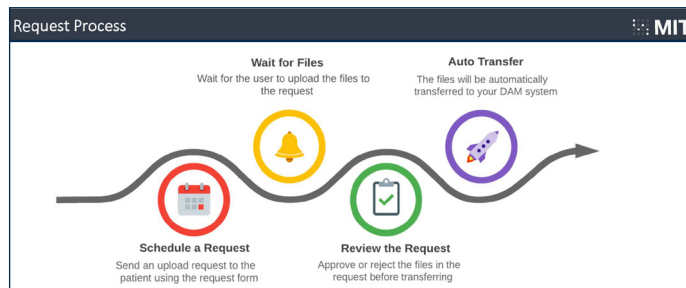

An accompanying on-premise 'connector' securely manages the files and sends them to your organisational image management system for permanent storage.

This hybrid approach not only simplifies the deployment for the organisation but also saves a lot of money!

MIT is available on an annual subscription basis and includes:

- Public portal (where patients log in to upload files) this includes the hosting charges.
- On-premise connector (to virus scan and transfer files).
- Support (covers on-premise connector and public portal for patients).

Different packages are available depending on data consumption.

MIT is part of our FLEX Product range which also includes:

## Compare

Select, compare & zoom up to 8 images simultaneously for pre and post operative comparison.

## Protect

Encrypt sensitive files prior to sending patient referrals and subject access requests.

## PDF+

Create PDF documents using pre-designed templates for case studies, referrals, and subject access requests.
